Solution Strategy

Suppose that A has been factored into the triangular form A = LU, where L is lower triangular and U is upper triangular.

(4) E > (4) E >

Solution Strategy

Suppose that *A* has been factored into the triangular form A = LU, where *L* is lower triangular and *U* is upper triangular. Then we can solve for **x** more easily by using a two-step process:

< ロ > < 同 > < 回 > < 回 >

Solution Strategy

Suppose that A has been factored into the triangular form A = LU, where L is lower triangular and U is upper triangular. Then we can solve for **x** more easily by using a two-step process:

• First we let $\mathbf{y} = U\mathbf{x}$ and solve the lower triangular system $L\mathbf{y} = \mathbf{b}$ for y. Since L is triangular, determining y from this equation requires only $O(n^2)$ operations.

< ロ > < 同 > < 三 > < 三 >

Algorithm

Matrix Factorization

Solution Strategy

Suppose that *A* has been factored into the triangular form A = LU, where *L* is lower triangular and *U* is upper triangular. Then we can solve for **x** more easily by using a two-step process:

- First we let $\mathbf{y} = U\mathbf{x}$ and solve the lower triangular system $L\mathbf{y} = \mathbf{b}$ for \mathbf{y} . Since *L* is triangular, determining \mathbf{y} from this equation requires only $O(n^2)$ operations.
- Once y is known, the upper triangular system Ux = y requires only an additional O(n²) operations to determine the solution x.

Algorithm

Matrix Factorization

Solution Strategy

Suppose that *A* has been factored into the triangular form A = LU, where *L* is lower triangular and *U* is upper triangular. Then we can solve for **x** more easily by using a two-step process:

- First we let $\mathbf{y} = U\mathbf{x}$ and solve the lower triangular system $L\mathbf{y} = \mathbf{b}$ for \mathbf{y} . Since *L* is triangular, determining \mathbf{y} from this equation requires only $O(n^2)$ operations.
- Once y is known, the upper triangular system Ux = y requires only an additional O(n²) operations to determine the solution x.

Solving a linear system $A\mathbf{x} = \mathbf{b}$ in factored form means that the number of operations needed to solve the system $A\mathbf{x} = \mathbf{b}$ is reduced from $O(n^3/3)$ to $O(2n^2)$.

- To determine the complementary lower triangular matrix L,

- ₹ ⊒ →

- This process forms the $U = A^{(n)}$ portion of the matrix factorization A = LU.
- To determine the complementary lower triangular matrix *L*, first recall the multiplication of $A^{(k)}\mathbf{x} = \mathbf{b}^{(k)}$ by the Gaussian transformation of $M^{(k)}$ used to obtain:

$$A^{(k+1)}\mathbf{x} = M^{(k)}A^{(k)}\mathbf{x} = M^{(k)}\mathbf{b}^{(k)} = \mathbf{b}^{(k+1)}$$

- This process forms the $U = A^{(n)}$ portion of the matrix factorization A = LU.
- To determine the complementary lower triangular matrix *L*, first recall the multiplication of $A^{(k)}\mathbf{x} = \mathbf{b}^{(k)}$ by the Gaussian transformation of $M^{(k)}$ used to obtain:

$$\mathcal{A}^{(k+1)}\mathbf{x} = \mathcal{M}^{(k)}\mathcal{A}^{(k)}\mathbf{x} = \mathcal{M}^{(k)}\mathbf{b}^{(k)} = \mathbf{b}^{(k+1)},$$

where $M^{(k)}$ generates the row operations

$$(E_j - m_{j,k}E_k) \rightarrow (E_j), \text{ for } j = k + 1, \dots, n.$$

< ロ > < 同 > < 三 > < 三 >

Rationale	Constructing LU	Example	Algorithm	Permutation Matrices
Matrix I	actorization			

To reverse the effects of this transformation and return to $A^{(k)}$ requires that the operations $(E_j + m_{j,k}E_k) \rightarrow (E_j)$ be performed for each i = k + 1, ..., n.

Rationale	Constructing LU	Example	Algorithm	Permutation Matrices
Matrix	Factorization			

To reverse the effects of this transformation and return to $A^{(k)}$ requires that the operations $(E_i + m_{i,k}E_k) \rightarrow (E_i)$ be performed for each j = k + 1, ..., n. This is equivalent to multiplying by $[M^{(k)}]^{-1}$.

Numerical Analysis (Chapter 6)

Rationale	Constructing LU	Example	Algorithm	Permutation Matrices
Matrix	Factorization			

The lower-triangular matrix *L* in the factorization of *A*, then, is the product of the matrices $L^{(k)}$:

$$L = L^{(1)}L^{(2)}\cdots L^{(n-1)} = \begin{bmatrix} 1 & 0 & \cdots & \cdots & 0 \\ m_{21} & 1 & \ddots & & \vdots \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \ddots & 0 \\ m_{n1} & \cdots & \cdots & m_{n,n-1} & 1 \end{bmatrix}$$

4 A N

The lower-triangular matrix *L* in the factorization of *A*, then, is the product of the matrices $L^{(k)}$:

$$L = L^{(1)}L^{(2)}\cdots L^{(n-1)} = \begin{bmatrix} 1 & 0 & \cdots & \cdots & 0 \\ m_{21} & 1 & \ddots & & \vdots \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \ddots & 0 \\ m_{n1} & \cdots & \cdots & m_{n,n-1} & 1 \end{bmatrix}$$

since the product of *L* with the upper-triangular matrix $U = M^{(n-1)} \cdots M^{(2)} M^{(1)} A$ gives

Rationale	Constructing LU	Example	Algorithm	Permutation Matrices
Matrix	Factorization			

$$LU = L^{(1)}L^{(2)}\cdots L^{(n-3)}L^{(n-2)}L^{(n-1)} \cdot M^{(n-1)}M^{(n-2)}M^{(n-3)}\cdots M^{(2)}M^{(1)}A$$

Algorithm

Permutation Matrices

Matrix Factorization: 4×4 Example

Part (b) Solution (2/3)

First, solve $L\mathbf{y} = \mathbf{b}$ (where $\mathbf{y} = U\mathbf{x}$:

$$L\mathbf{y} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 2 & 1 & 0 & 0 \\ 3 & 4 & 1 & 0 \\ -1 & -3 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{bmatrix} = \begin{bmatrix} 8 \\ 7 \\ 14 \\ -7 \end{bmatrix}$$

Numerical Analysis (Chapter 6)

.

Matrix Factorization: 4×4 Example

Part (b) Solution (2/3)

First, solve $L\mathbf{y} = \mathbf{b}$ (where $\mathbf{y} = U\mathbf{x}$:

$$L\mathbf{y} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 2 & 1 & 0 & 0 \\ 3 & 4 & 1 & 0 \\ -1 & -3 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{bmatrix} = \begin{bmatrix} 8 \\ 7 \\ 14 \\ -7 \end{bmatrix}$$

This system is solved for \mathbf{y} by a simple forward-substitution process:

$$y_1 = 8$$

$$2y_1 + y_2 = 7 \quad \Rightarrow \ y_2 = 7 - 2y_1 = -9$$

$$3y_1 + 4y_2 + y_3 = 14 \quad \Rightarrow \ y_3 = 14 - 3y_1 - 4y_2 = 26$$

$$-y_1 - 3y_2 + y_4 = -7 \quad \Rightarrow \ y_4 = -7 + y_1 + 3y_2 = -26$$

.

Permutation Matrices

Matrix Factorization: Permutation Matrices

Limitations of the LU Factorization Algorithm

- We assumed that $A\mathbf{x} = \mathbf{b}$ can be solved using Gaussian elimination without row interchanges.
- From a practical standpoint, this factorization is useful only when row interchanges are not required to control round-off error.
- We will now consider the modifications that must be made when row interchanges are required.

→ ∃ → < ∃</p>

Permutation Matrices

Matrix Factorization: Permutation Matrices

We begin with the introduction of a class of matrices that are used to rearrange, or permute, rows of a given matrix.

Permutation Matrices

Matrix Factorization: Permutation Matrices

We begin with the introduction of a class of matrices that are used to rearrange, or permute, rows of a given matrix.

Permutation Matrix

An $n \times n$ permutation matrix $P = [p_{ij}]$ is a matrix obtained by rearranging the rows of I_n , the identity matrix. This gives a matrix with precisely one nonzero entry in each row and in each column, and each nonzero entry is a 1.

Permutation Matrices

Matrix Factorization: Permutation Matrices

Example

The matrix

$$\mathbf{P} = \left[\begin{array}{rrr} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{array} \right]$$

is a 3×3 permutation matrix.

Numerical Analysis (Chapter 6)

Numerical Analysis (Chapter 6)

Matrix Factorization

R L Burden & J D Faires 40 / 46

Permutation Matrices & Gaussian Elimination (Cont'd)

 This implies that for any nonsingular matrix A, a permutation matrix P exists for which the system

 $PA\mathbf{x} = P\mathbf{b}$

can be solved without row interchanges.

Matrix Factorization: Permutation Matrices

Permutation Matrices & Gaussian Elimination (Cont'd)

 This implies that for any nonsingular matrix A, a permutation matrix P exists for which the system

 $PA\mathbf{x} = P\mathbf{b}$

can be solved without row interchanges. As a consequence, this matrix *PA* can be factored into PA = LU, where *L* is lower triangular and *U* is upper triangular.

Matrix Factorization: Permutation Matrices

Permutation Matrices & Gaussian Elimination (Cont'd)

 This implies that for any nonsingular matrix A, a permutation matrix P exists for which the system

$$PA\mathbf{x} = P\mathbf{b}$$

can be solved without row interchanges. As a consequence, this matrix *PA* can be factored into PA = LU, where *L* is lower triangular and *U* is upper triangular.

• Because $P^{-1} = P^t$, this produces the factorization

$$A = P^{-1}LU = (P^tL)U.$$

Numerical Analysis (Chapter 6)

Permutation Matrices & Gaussian Elimination (Cont'd)

 This implies that for any nonsingular matrix A, a permutation matrix P exists for which the system

$$PA\mathbf{x} = P\mathbf{b}$$

can be solved without row interchanges. As a consequence, this matrix *PA* can be factored into PA = LU, where *L* is lower triangular and *U* is upper triangular.

• Because $P^{-1} = P^t$, this produces the factorization

$$A = P^{-1}LU = (P^tL)U.$$

• The matrix U is still upper triangular, but $P^{t}L$ is not lower triangular unless P = I.

Matrix Factorization: Permutation Matrices

Example

Determine a factorization in the form $A = (P^t L)U$ for the matrix

$$A = \begin{bmatrix} 0 & 0 & -1 & 1 \\ 1 & 1 & -1 & 2 \\ -1 & -1 & 2 & 0 \\ 1 & 2 & 0 & 2 \end{bmatrix}$$
